Learning goals

- Separate data from code in a Lisp list.
- Explain `quote` and `eval` with one example each.

Key concepts

What is a list?	A list is a parenthesized sequence of atoms and sublists. `(A B C)` has three elements. [PD0, p. 14]
Data or code?	The same list can be read as data or as a function application. The operator position decides the reading. [PD0, p. 14]
Why quote?	`quote` preserves an expression as data without evaluating it. [PD0, p. 15]

Examples

WORKED EXAMPLE

Read `(A B C)` as data: A, B and C are elements. Read it as code: function `A` is applied to `B` and `C`. [PD0, p. 14]

Your turn	Write one sentence that distinguishes representation from evaluation.

NOTES

Summary

SUMMARY

Representation is shared; evaluation depends on context. Use `quote` for data and `eval` for code. [PD0, p. 15]
