SAMPLE

Revision Sheet

Short definitions, comparison, recall and a one-page synthesis.

1. Scope and map

This sample shows the pre-exam review page for one source section. There are no long paragraphs; each block does one job.

> MUST KNOW
> When code and data share one representation, the program itself becomes processable data. [PD0, p. 12]

2. Must-know

Definition: The first element of a list is consed onto the rest. [PD0, p. 13]

Distinction: A list as data versus a function application as code. [PD0, p. 14]

Condition: Evaluation order depends on the operator type. [PD0, p. 15]

Trap: `quote` and `eval` are not the same operation. [PD0, p. 16]

3. Comparisons

Table 1 Data and code readings

Reading	Input	Result
Data	`(A B C)`	A three-element list
Code	`(A B C)`	Function `A` applied to `B` and `C`

PD0, p. 14

4. Exam traps

> EXAM TRAP
> Do not treat the shared representation as a claim that evaluation is also shared. [PD0, p. 14]

5. Recall

> RECALL
> How is `(A B C)` read as data and as code?

ANSWER

As data it is a three-element list; as code it applies function `A` to arguments `B` and `C`. [PD0, p. 14]

6. One-page synthesis

EXAM REVISION

One-page synthesis

- Code and data share one representation.
- `quote` preserves data; `eval` evaluates it.
- A list contains atoms and sublists.
- Function application starts with the operator on the left.
- In an exam, separate the data reading from the code reading first.

7. Review plan

REVIEW PLAN

Re-read the recall answers, redraw the map, then solve one faded example without looking at the answer key. [PD0, p. 14]
